1. Get to the building

Goal: stand in front of the building you want to add, with the map showing it.

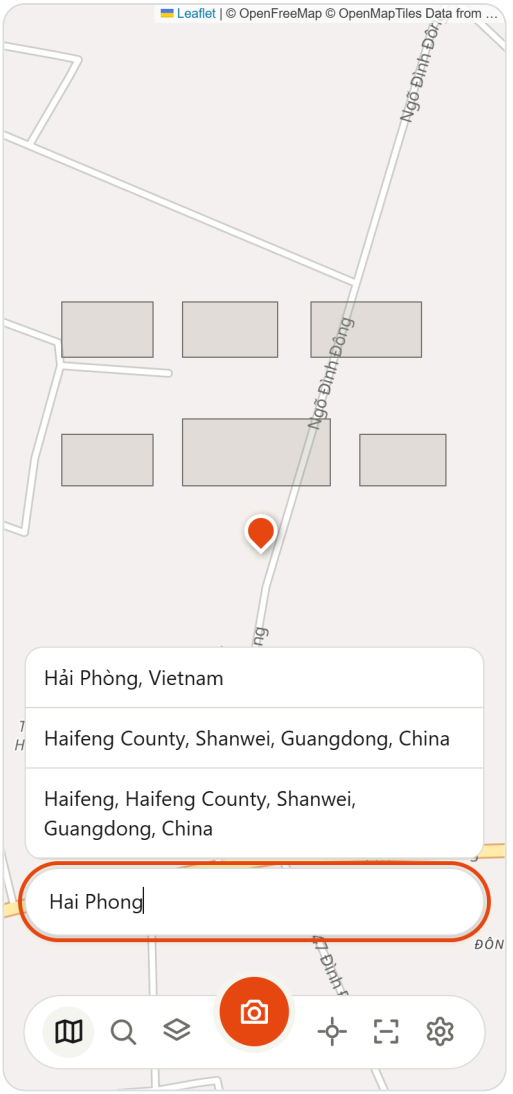

1 Open the map and allow location.

Orange pin = you. Grey boxes = buildings already on the map.

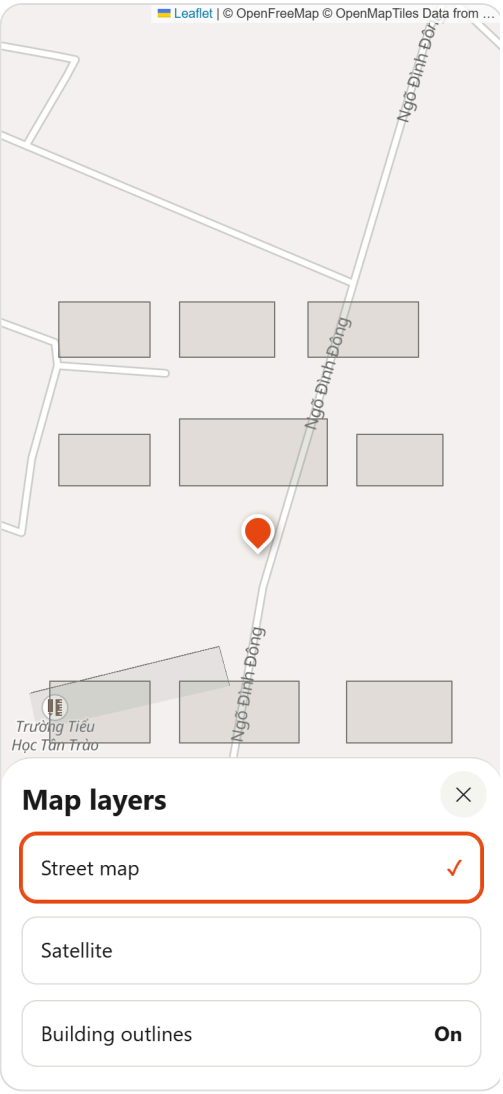

2 Tap the building you are facing.

See what the map knows. Here: no name, no height. That is what you will add.

3 (optional) Not near it yet? Tap the magnifier and search a place.

Type 3+ letters, tap a result.

4 (optional) Not sure which building? Open Layers.

Switch to Satellite and compare with what you see.

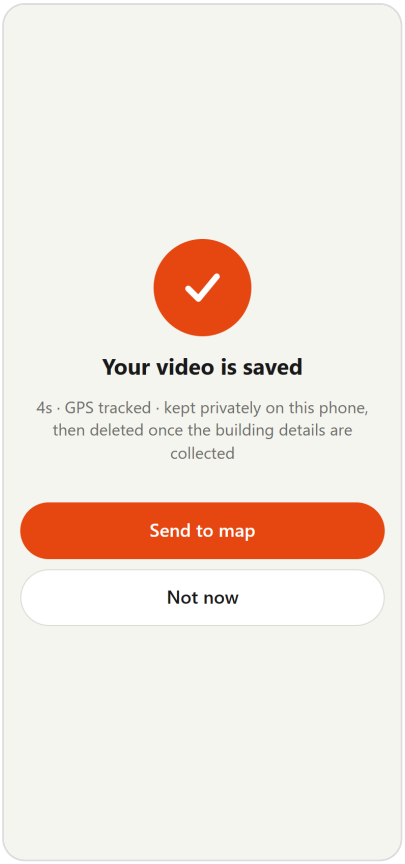

2. Film it, check the AI, put it on the map

Goal: turn a short walk-by video into a correct name, height and floor count on the map.

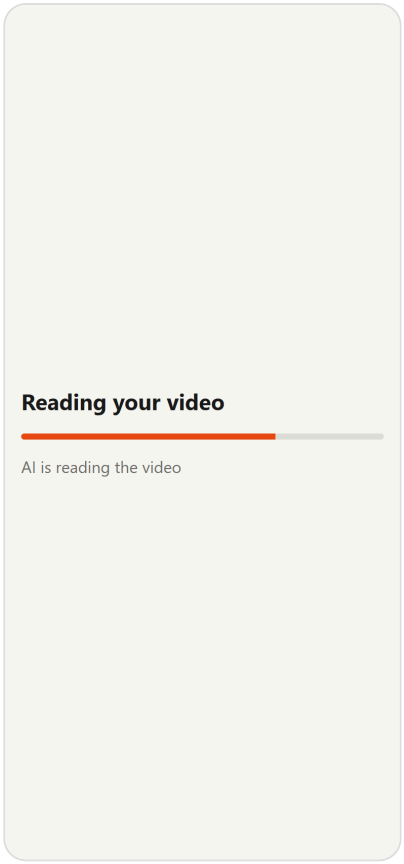

1 Tap the big camera and film the front of the building.

Recording starts by itself. Keep the sign in view. The small map shows where you stand. Tap the red square to stop.

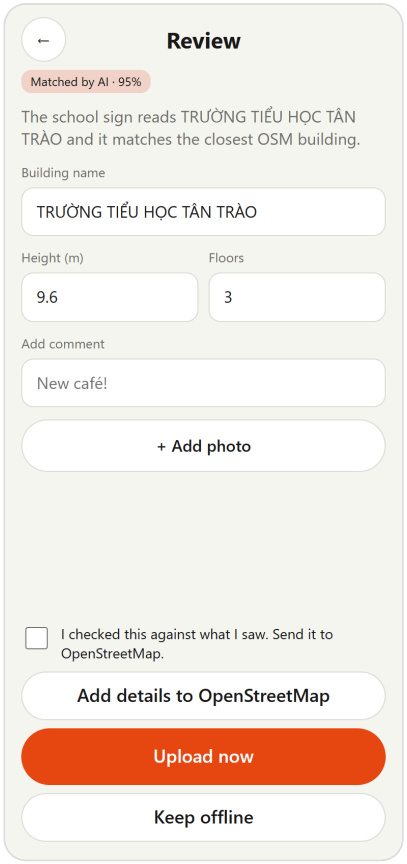

2 Tap Send to map.

Not now keeps the video and returns to the map.

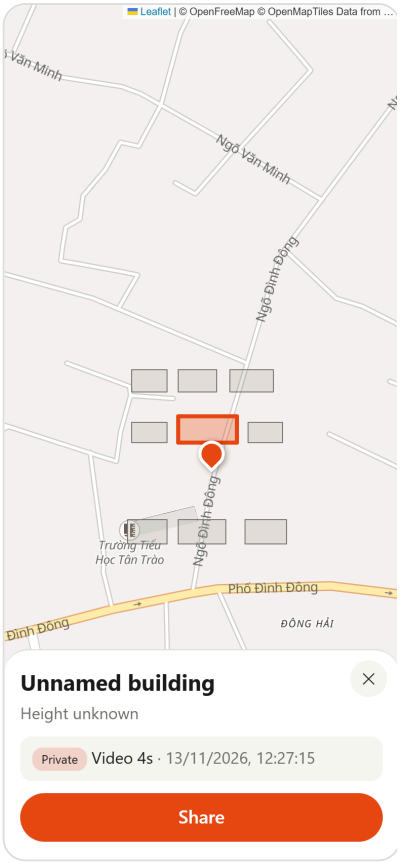

3 Wait while the AI reads it.

It finds nearby buildings, then reads the video. Up to a minute.

4 Check every field, fix mistakes, then choose.

AI only guesses. Upload now shares the video on the map. Keep offline keeps it on your phone. Add details to OpenStreetMap needs your login and the tick box.

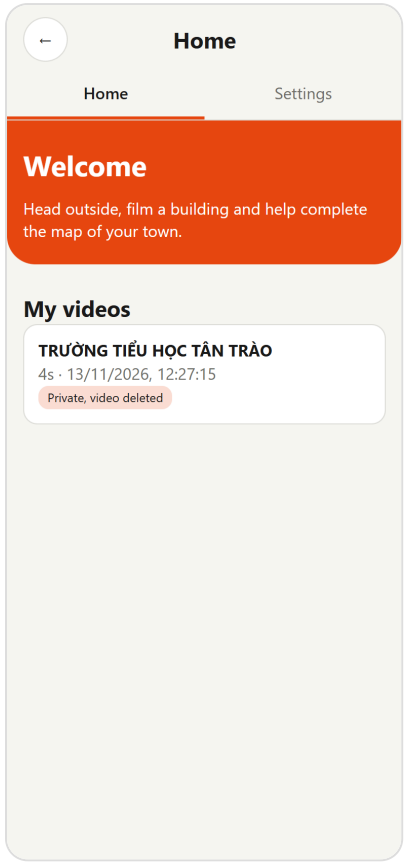

5 See your contribution on the building.

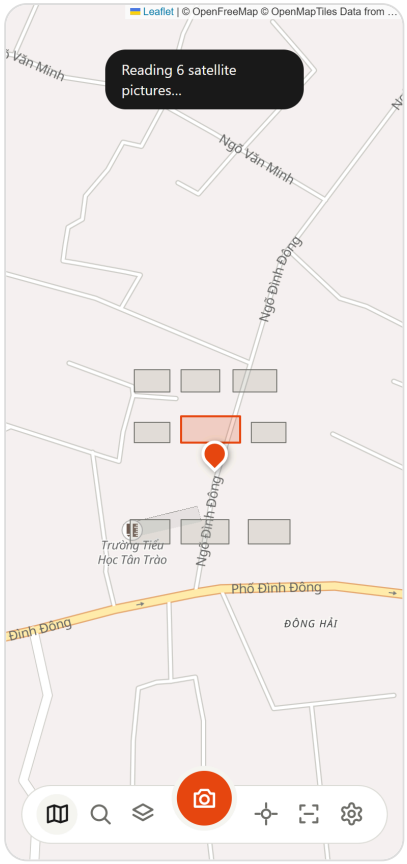

Your video is listed on the building you filmed.

3. Afterwards: keep track and fill the gaps

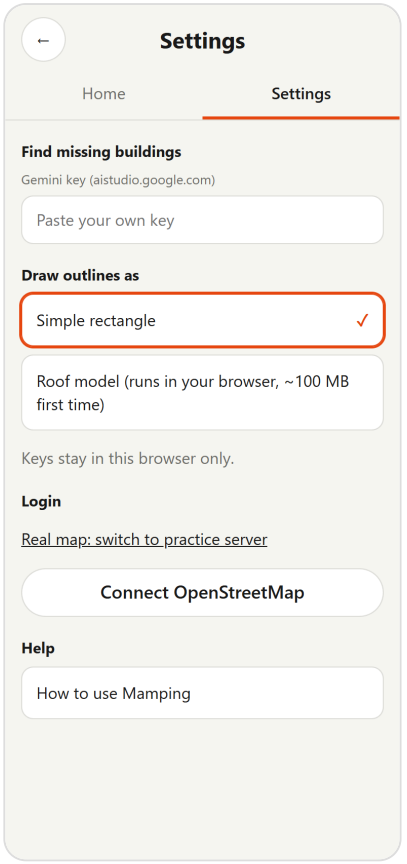

Goal: find your videos again, and add buildings the map is missing.

1 Gear, then Settings, then Home.
Your videos are named after the building.

2 Tap the corner-brackets icon to find missing buildings.
The AI reads the satellite picture of what you see. Tick the ones to add.

3 Set up once in Settings.
Paste your own Gemini AI key (needed for step 2) and connect OpenStreetMap (needed to add details or buildings).

Tip: the gear menu also has **How to use Mamping**, a short tour inside the app.

About these pictures: they were taken with a test camera showing an illustrated building, and a practice building on the map, so nothing real was published. The review in step 2.4 is the real AI answer for that clip. Screenshots used Keep offline.
